EDUCATION

Bachelor of Software Engineering (Honours)

Monash University, 2022-2027 (expected)

- Applying advanced data structures and algorithm analysis to optimise application performance, specifically focusing on Big O complexity reduction in spatial search queries and data stream processing
- Utilising Agile software methodology to manage project lifecycles, participating in iterative sprint planning, continuous integration, and collaborative peer reviews to maintain high-quality code standards.

CERTIFICATIONS

CompTIA Security+ (in progress)

IBM CompTIA A+

Google Cybersecurity Professional

EXPERIENCE

Company: Ensign Laboratories

2022-2026

Title: GMP Processor

- Adhered to strict Standard Operating Procedures (SOPs) and regulatory compliance frameworks
- Performed quality control checks and risk-minimisation procedures across production processes
- Collaborated within cross-functional teams under strict production deadlines, applying disciplined time management to meet regulatory and operational targets

PROJECTS

GRC Report Automation Agent

Source: github.com/n8nunes/security-analysis-automation

Platforms, Skills Developed and Technology Used: Python, Ollama, Tavily, HIBP API, NIST CSF, ISO 27001, Essential Eight, OAIC APP

- Built an autonomous tool that performs passive external reconnaissance on a company's domain and public footprint SSL/TLS posture, security headers, breach history, and news intelligence.
- Engineered a two-pass local AI pipeline (Ollama) that extracts technical findings, then maps them to four Australian and international compliance frameworks, generating a structured maturity score and prioritised risk register
- Designed the system to run with zero ongoing API cost, addressing a real gap. Major commercial GRC platforms do not natively support Australian frameworks including Essential Eight and APRA CPS 234
- Outputs a client-ready report with letter-grade scoring (1–10) and specific, evidence-linked recommendations, condensing work into a single automated pass

nfx // Personal Trading Journal

Source: github.com/n8nunes/trading-journal

Platforms and Technology Used: React, Typescript, Claude Code, Vercel, MetaApi, CI/CD pipelines, Firebase

- Designed and shipped a production web platform for futures trade journaling, using AI-assisted development practices (Claude Code) to accelerate feature delivery without compromising code quality
- Implemented Firebase authentication and multi-user data isolation to ensure data privacy and security across concurrent users
- Built and maintained a CI/CD pipeline on Vercel with automated testing, enabling rapid, reliable feature deployment

ADDITIONAL SKILLS AND TECHNOLOGIES

In progress: AWS Cloud Solutions Architect

Active Directory, Linux, Google Workspace, Splunk, Wireshark, Flutter, Docker, Git, Stitch.
